Weather and Climate

1.

Climate

Climate is the average weather condition on an area for many years.

Climate of Bangladesh

In Bangladesh, there are six seasons such as Summer, the Rainy season, early Autumn, late Autumn, Winter and Spring. In Bangladesh Summer consists of Baishakh and Joystha and it is the warmest season of the year. The Rainy season consists of Ashar and Shraban and it comes with heavy rainfall. Early Autumn consist of Vadra and Ashwin. White and fluffy clouds are seen in the sky in this season. Kartik and Agrahaon are the late Autumn. This is the season of harvest. Pous and Magh are Winter when we usually feel cold in Bangladesh. Then gradually the cold is relieved and the weather is getting warmer in Spring months, Falgun and Chaitra. This is the usual pattern of Bangladesh's climate.

2.

Latitude

The latitude is the distance from the equator.

Climate depends on latitude distance:

Near the equator, the North pole Sun's rays shine straight down. The Sun warms the surface of the Earth most strongly at or near Sunlight equator. As a result, place near the equator become the warmest places. As the surface of the Earth is curved, places further away from the equator are warmed much less strongly by the Sun, and so they are colder. The higher the latitude, the colder the climate is.
