The energy value increases in successive shells outwards the nucleus. The arrangement of orbitals on the basis of energy is based upon their (n+1) value. The lower the value of (n+1), the lower is the energy. For orbitals having same values of (n+1), the orbital with the lower value of n will have lower energy. a) What is called electronic configuration? b) Show why 3d orbital exist but 2d does not exist? c) How the value of 'l' is used to specify different orbitals and the maximum electron containing capacity of any orbital? Explain. d) Explain, taking calcium as an example, how electrons are distributed in orbitals of atom using the stem-mentioned rules.
